

Brulin Floor Neutralizer Winter Salt Residue Remover

Winter is right around the corner...

You may have road salt or other ice melt on order for exterior areas of your facility, sidewalks and parking lots. But are you prepared to handle the salt residue that will be tracked in from the outside during inclement weather?

The makeup of most ice melting products is based around calcium chloride or salt, because of its effective melting properties and because it is relatively inexpensive. The problem when it comes to floor care is that it has a high pH, just like floor stripper.

Tracked-in salt from the outside can wreak havoc on your floors, necessitating complete strip outs or scrub and recoats earlier than planned. To remove salt residue, it must be neutralized.

Incorporate **Brulin Floor Neutralizer** into your winter floor care maintenance program as a daily damp mop solution in entryways, foyers, lobbies, waiting rooms, etc. With a pH of 3, it neutralizes the high pH alkaline residue of the salts, removes the hazy white salt film and prevents it from getting tracked through other areas of your facility.
